Protocol Summary

PasswordStore is a protocol dedicated to storage and retrieval of a user's passwords. The protocol is designed to be used by a single user, and is not designed to be used by multiple users. Only the owner should be able to set and access this password.

Risk Classification

		Impact		
		High	Medium	Low
	High	H	H/M	M
Likelihood	Medium	H/M	M	M/L
	Low	M	M/L	L

We use the CodeHawks severity matrix to determine severity. See the documentation for more details.

Audit Details

The findings described in this document correspond the following commit hash:

```
2e8f81e263b3a9d18fab4fb5c46805ffc10a9990
```

Scope

```
./src/
#-- PasswordStore.sol
```

Roles

- Owner: Is the only one who should be able to set and access the password.

For this contract, only the owner should be able to interact with the contract.

Executive Summary

Issues found

Severity	Number of issues found

Findings

High

[H-1] Storing the password on-chain makes it visable to anyone, and no longer private

Description: All data stored on-chain is visable to anyone, and can be read directly from the blockchain. The `PasswordStore::s_password` variable is intended to be a private variable and only accessed through the `PasswordStore::getPassword` function, which is intended to be a only called by the owner of the contract.

Impact: Anyone can read the private password, severly breaking the functionality of the protocol.

Proof of Concept:(Proof of Code)

The below test case shows how anyone can read the password directly from the blockchain.

Recommended Mitigation:

1. Create a locally running chain

```
make anvil
```

2. Deploy the contract to the chain

```
make deploy
```

3. Run the storage tool

We use `1` because that's the storage slot of `s_password` in the contract.

```
cast storage <ADDRESS_HERE> 1  --rpc-url http://127.0.0.1:8545
```

You''ll get an output that looks like this:

`0x6d7950617373776f726400000000000000000000000000000000000000000014`

You can then parse that hex to a string with:

```
cast parse-bytes32-string
0x6d7950617373776f726400000000000000000000000000000000000000000014
```

And get an output of:

```
myPassword
```

###Likelyhood & Impact: -Imapct: HIGH: -Likelihood: HIGH -Severity: HIGH

[H-2] `PasswordStore::setPasword` has no access controls, meaning a non-owner could change the password

Description: The `PasswordStore::setPasword` function is set to be an `external` function, however, the natspec of the function and overall purpose of the smart contract is that `This function allows only the owner to set a new password.`

```
    function setPassword(string memory newPassword) external {
            // @audit - There are no access controls
        s_password = newPassword;
```

```
        emit SetNetPassword();
    }
```

Impact: Anyone can set/change the password of the contract, severly breaking the contract intended functionality.

Proof of Concept: Add the following to the `PasswordStore.t.sol` test file.

```
    function test_anyone_can_set_password(address randomAddress) public {
        vm.assume(randomAddress != owner);
        vm.prank(randomAddress);
        string memory expectedPassword = "myNewPassword";
        passwordStore.setPassword(expectedPassword);

        vm.prank(owner);
        string memory actualPassword = passwordStore.getPassword();
        assertEq(actualPassword, expectedPassword);
    }
```

Recommended Mitigation: Add an access control conditional to the `setPassword` function.

```
if(msg.sender != s_owner) {
    revert PasswordStore_NotOwner
}
```

Info

[I-1] The `PasswordStore::getPassword` natspec indicates a parameter that doesn't exist, causing the natspec to be incorrect

Description:

```
    /*
     * @notice This allows only the owner to retrieve the password.
@>   * @param newPassword The new password to set.
     */
    function getPassword() external view returns (string memory) {
```

The natspec for the function `PasswordStore::getPassword` indicates it should have a parameter with the signature `getPassword(string)`. However, the actual function signature is `getPassword()`.

Impact: The natspec is incorrect.

Recommended Mitigation: Remove the incorrect natspec line.

```
-     * @param newPassword The new password to set.
```
